Lens Clock

The lens clock is another critical measurement tool in the creation of prescription eyeglasses. The lens clock allows an optician, optometrist or ophthalmologist to measure the diopter curve of the spherical lens surface.

Features ball tips and measures +/- 0 to 20 diopters.

Packed in a protective box.

ET2 Cross Cylinder	<ul style="list-style-type: none"> • Cross Cylinder sold individually • Measurements available: +/- 0.25, +/- 0.50, +/- 1.00 • Price per cross cylinder 	By Quote	20% off
--------------------	--	----------	---------

Cross Cylinder

3 Piece Set in a protective case
Measurements: -0.25, -0.50, -1.00

Lenses are contrary dioptric in two axis positions and used to examine the degree and axis position of the cylindrical lens for determining astigmatism. To use, put the cross cylinder lens before cylindrical lens and make its one axis coincide with the axis position, then turn the cross cylinder lens 90° counter-clockwise and see the change of vision. If the patient's vision has no change, the degree of the cylindrical lens used can be considered as suitable, otherwise, the degree should be adjusted until patient can see correctly.
